

AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions of claims in the application:

Listing of Claims:

1. (Currently amended) An interactive computer-implemented system for specifying and executing temporal order events, comprising a processor executing:
a constraint component that receives loose temporal constraints associated with a plurality of events; and
a system information component that receives execution system information; and
an order component that determines an event order in accordance with the loose temporal constraints and selects an optimal event order based at least in part on execution system information, wherein the event order specifies the execution order of events.
2. (Original) The system of claim 1, wherein the constraint is an event start and/or a stop time.
3. (Currently amended) The system of claim 1, wherein the constraint is event duration and/or a filter.
4. (Cancelled)
5. (Original) The system of claim 1, further comprising a system information component that provides information about an execution system to the order component to facilitate selection of an optimal event order.
6. (Original) The system of claim 5, the information about an executing system includes available memory.

7. (Original) The system of claim 5, the information about an execution system includes data throughput rate.

8. (Currently amended) An interactive computer-implemented system for specifying and executing temporal order events, comprising a processor executing:

a display component that provides a plurality of object workspaces, the workspaces are user interfaces including ~~at least one of~~ a past, present and/or future space, the present space is an editable area; and

a design component that temporally associates and/or disassociate objects in the editable area wherein non-associated objects order of execution is determined via utility-based analysis.

9. (Previously Presented) The system of claim 8, object workspaces that facilitate a graphical-based approach to specify relationships amongst objects.

10. (Cancelled)

11. (Original) The system of claim 8, non-associated objects are executed randomly.

12. (Original) The system of claim 8, the design component comprising a specification component that receives hard start and/or end times for events associated with objects.

13. (Original) The system of claim 8, the design component temporally associates objects as a function of respective location in the editable area.

14. (Original) The system of claim 8, further comprising a duration component that receives information regarding event duration.

15. (Original) The system of claim 8, the design component receives and executes information related to nested events associated with respective objects.

16. (Original) The system of claim 8, further comprising a policy component that applies pre-defined rules to execution of the objects.
17. (Original) The system of claim 8, further comprising a policy component that applies pre-defined rules to editing of the objects.
18. (Original) The system of claim 8, the design component receives and executes information regarding hierarchical relationship of respective objects.
19. (Original) The system of claim 8, the design component receives and executes information regarding dependency relationship of respective objects.
20. (Original) The system of claim 8, further comprising a query component that searches for events that satisfy a query, and displays objects associated with the events in temporal order.
21. (Previously Presented) The system of claim 20, the query component provides context information for respective objects.
22. (Original) The system of claim 8, objects placed in the past area are executed prior to objects in the present area.
23. (Original) The system of claim 8, objects placed in the future area are executed after objects in the present area.
24. (Original) The system of claim 8, the design component associates objects in a non-linear conditional manner.
25. (Original) The system of claim 8, the design component associates objects via iterative loops.

26. (Original) The system of claim 8, the design component associates objects based on a specified version.

27. (Currently amended) A computer-implemented method for specifying and executing temporal order events comprising the following computer executable instructions stored on a tangible computer readable medium:

receiving loose temporal constraints associated with a plurality of events;
generating one or more event execution orders in accordance with the constraints; and
receiving execution system information; and
selecting outputting an optimal event order based at least in part on execution system information.

28. (Cancelled)

29. (Currently amended) A method for object authoring implemented on a computer comprising the following computer executable instructions stored on a tangible computer readable medium:

receiving object data associated with events from a workspace including at least one of a past, present, and future area;
associating objects temporally based at least in part upon relative object locations; and
determining the execution order of events based on object associations and information regarding an execution system that executes the events.

30. (Original) The method of claim 29, further comprising associating objects based on one or more operational objects.

31. (Currently amended) The method of claim 30, wherein the operational objects correspond to at least a loop, a trigger, a conditional and hard start and/or stop times.

32-34. (Cancelled)

35. (Original) The method of claim 29, wherein objects are associated in a non-linear conditional manner.

36. (Original) The method of claim 29, wherein the objects are associated *via* iterative loops.

37-38. (Cancelled)

39. (New) The system of claim 8, wherein information about event start and stop times and event duration is communicated with a particular object.

40. (New) The system of claim 39, wherein the objects are bars and fuzzy edges on the bars indicate an unspecified time.

41. (New) The system of claim 40, wherein the fuzzy edges on at beginning of the bar indicate an unspecified start time and the fuzzy logic on at end of the bar indicates an unspecified end time and/or duration.

42. (New) The system of claim 40, wherein hard bold edges on the bar specifies specific start and/or stop time.

43. (New) The system of claim 1, wherein the execution system information comprises at least available memory, cache coherency, data throughput and number of processors of the system.
